3.ABOUT US PAGE

About Us

Welcome to the Online Book Library System — your digital gateway to discovering, managing, and enjoying books from anywhere.

Our platform is built using **ASP.NET Core MVC** with **Entity Framework Core** and a SQL Server backend. We aim to offer a simple and efficient way for users to manage a library of books online.

With features like adding, viewing, editing, and deleting books, our goal is to support students and developers in understanding real-world web application architecture using the MVC pattern.

Future enhancements may include role-based access, user-specific libraries, book recommendations, and cloud-based deployment via Azure.

Developed as a Capstone Project.
